

1 ABSTRACT

2 A method for micro-hermetic packaging of an optical device comprises: forming a
3 micro-hermetic cavity on a substrate; providing a transmission optical waveguide
4 transferring optical power between the interior and the exterior of the micro-hermetic
5 cavity; fabricating or mounting at least one optical device within the micro-hermetic
6 cavity; enabling optical power transfer between the optical device and the transmission
7 optical waveguide; and sealing the optical device within the micro-hermetic cavity. The
8 micro-hermetic cavity may be fabricated of a size comparable to the optical device, and
9 many such cavities may be simultaneously fabricated on a single substrate using wafer-
10 scale processing. The transmission optical waveguide, electrical feed-throughs, and/or
11 other monitoring/controlling components may be provided with the micro-hermetic cavity
12 on the same substrate, or as a separate component and/or on a separate substrate.
13 Alternatively, the optical device, transmission optical waveguide, and any other
14 associated components may be embedded in transparent material for hermetic sealing.
